 - Acid-base neutralization reactions involve the transfer of protons (H^+) from acids to bases.
 - The equivalence point is where molar amounts of acid and base are stoichiometrically equal.
 - Indicators change color at specific pH ranges, signaling the endpoint.

Objective of the Experiment

- To determine the molarity of an unknown acid solution (e.g., HCl) by titrating it with a standard base (e.g., NaOH).
- To understand and identify the equivalence point through indicator choice.
- To practice titration techniques and perform calculations to find unknown concentrations.

Materials and Methods

The materials and methods section should provide a detailed, reproducible account of the experimental setup.

Materials Used

Procedure

- Preparation of Titrant:
 - Ensure the NaOH solution is standardized (if not pre-standardized).
 - Rinse the burette with the NaOH solution; fill it, and record the initial reading.
- Preparation of Sample:
 - Use a pipette to transfer a measured volume (e.g., 25.00 mL) of the unknown acid solution into the conical flask.
 - Add a few drops of phenolphthalein indicator.
- Titration Process:

- Slowly add NaOH from the burette to the acid while swirling continuously.

$$M_{\text{acid}} = \frac{M_{\text{base}} \times V_{\text{base}}}{V_{\text{acid}}}$$

 $\backslash$

Where:

- M_{base} = molarity of NaOH
