Dimensional Modeling: The Heart of Kimball's Methodology

Why Dimensional Modeling?

Kimball's emphasis on dimensional modeling stems from its simplicity and effectiveness in facilitating query performance and understandability. Unlike normalized schemas, dimensional models optimize for read performance and ease of use.

Components of a Dimensional Model:

- Fact Tables: Central tables containing numeric measures
- Examples: Sales revenue, units sold
- Typically contain foreign keys referencing dimensions
- Dimension Tables: Descriptive attributes providing context
- Examples: Customer demographics, product categories

Designing Effective Star Schemas

- Identify the Grain: Decide on the level of detail stored (e.g., daily sales per store)
- Select Dimensions: Choose relevant descriptive attributes
- Create Surrogate Keys: Use non-meaningful, system-generated keys for stability
- Define Hierarchies: For drill-down and aggregation (e.g., Year > Quarter > Month)

Handling Slowly Changing Dimensions (SCDs)

Kimball categorizes SCDs into types, with Type 2 being most common—tracking historical changes by creating new records. Proper management of SCDs ensures accurate historical reporting.

The Bus Architecture and Conformed Dimensions

The Bus Architecture

Kimball's bus architecture promotes building a set of conformed dimensions that serve multiple data marts, enabling integrated, enterprise-wide analysis.

Benefits:

- Consistency in metrics and dimensions
- Reduced redundancy
- Easier maintenance and scalability

Conformed Dimensions

Dimensions that are standardized across various subject areas, supporting cross-functional analysis. For example, a Customer Dimension used in sales, marketing, and service marts.
